

Missouri NWI

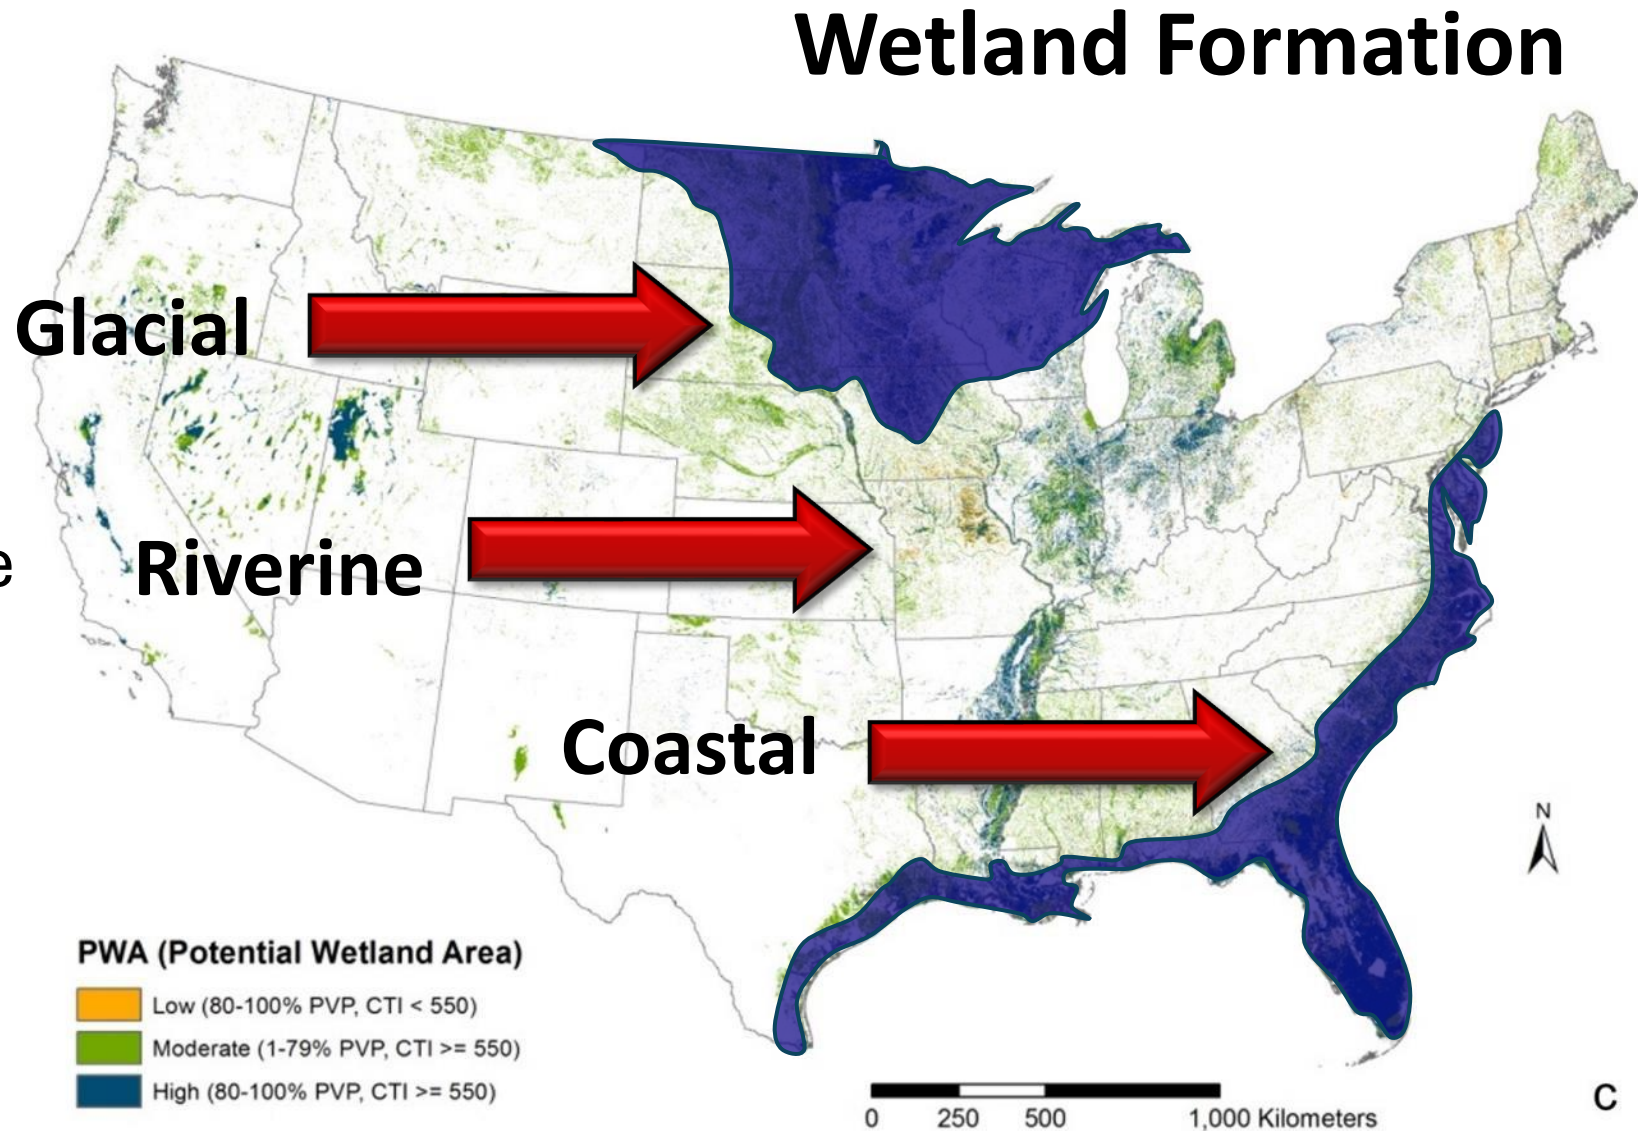

Critical Linkages

Frank Nelson, Wetland Coordinator,
Missouri Dept. of Conservation

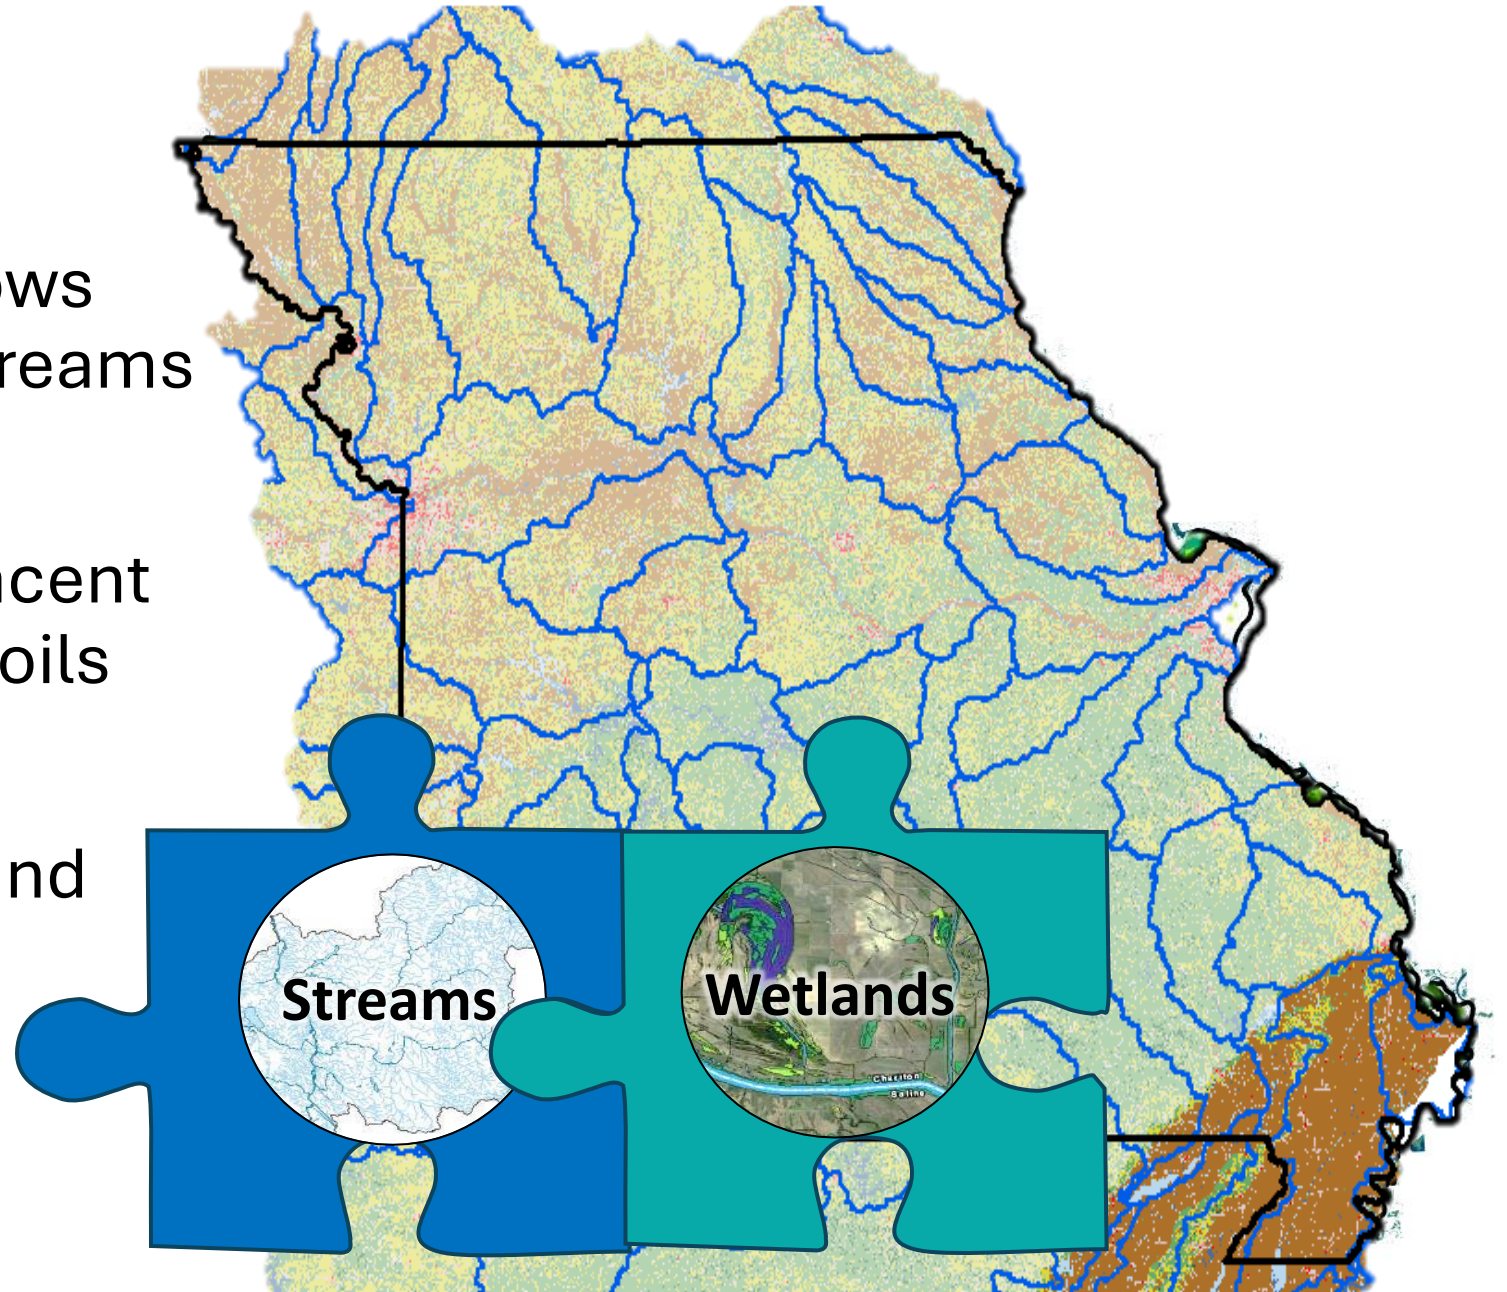

Extent of Wetlands in the US

- Wetland extent varies across North America
- Missouri's wetlands shaped by fluvial/riverine processes

Extent of Wetlands in Missouri

- Distribution of NWI follows Missouri's Rivers and Streams
- Many fall within the adjacent floodplain and alluvial soils
- And influenced by the land use in the surrounding watersheds

National Blue-Green Digital GIS Infrastructure

Geospatial Workhorses across
public and private sectors

NWI

National Wetlands Inventory

National Blue-Green Digital GIS Infrastructure

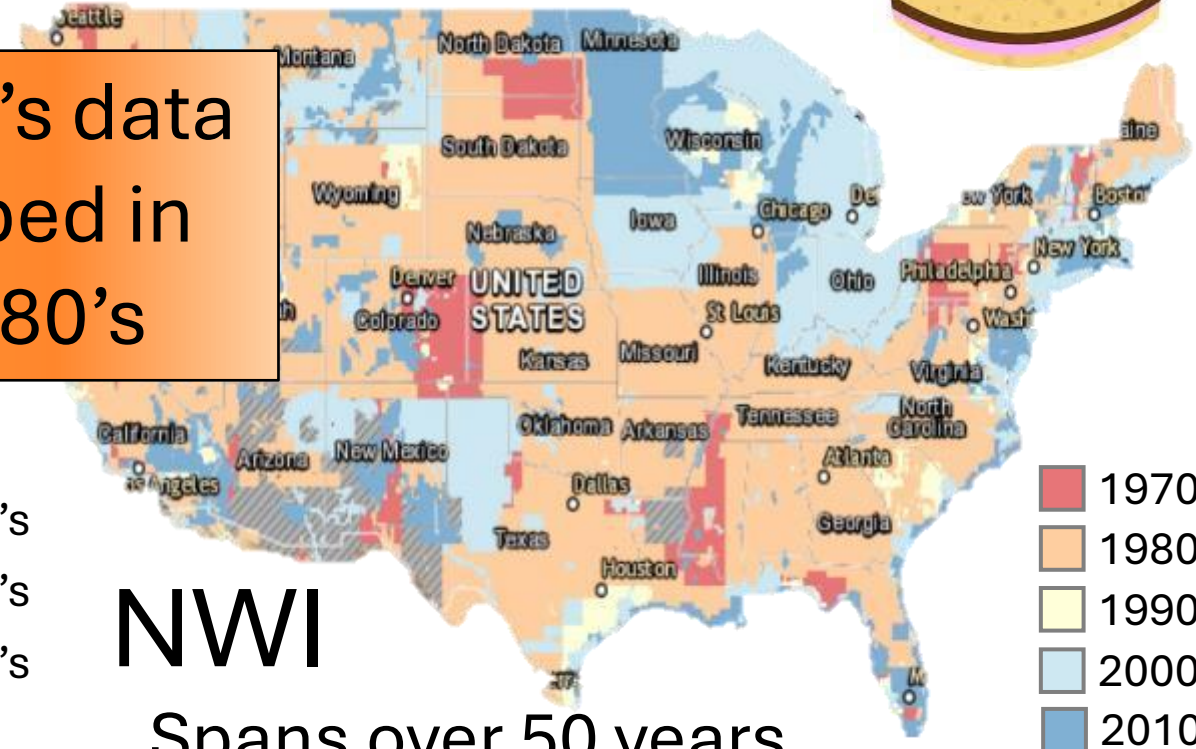

Spans over 64 years

Information from Analisa Stasey, USGS

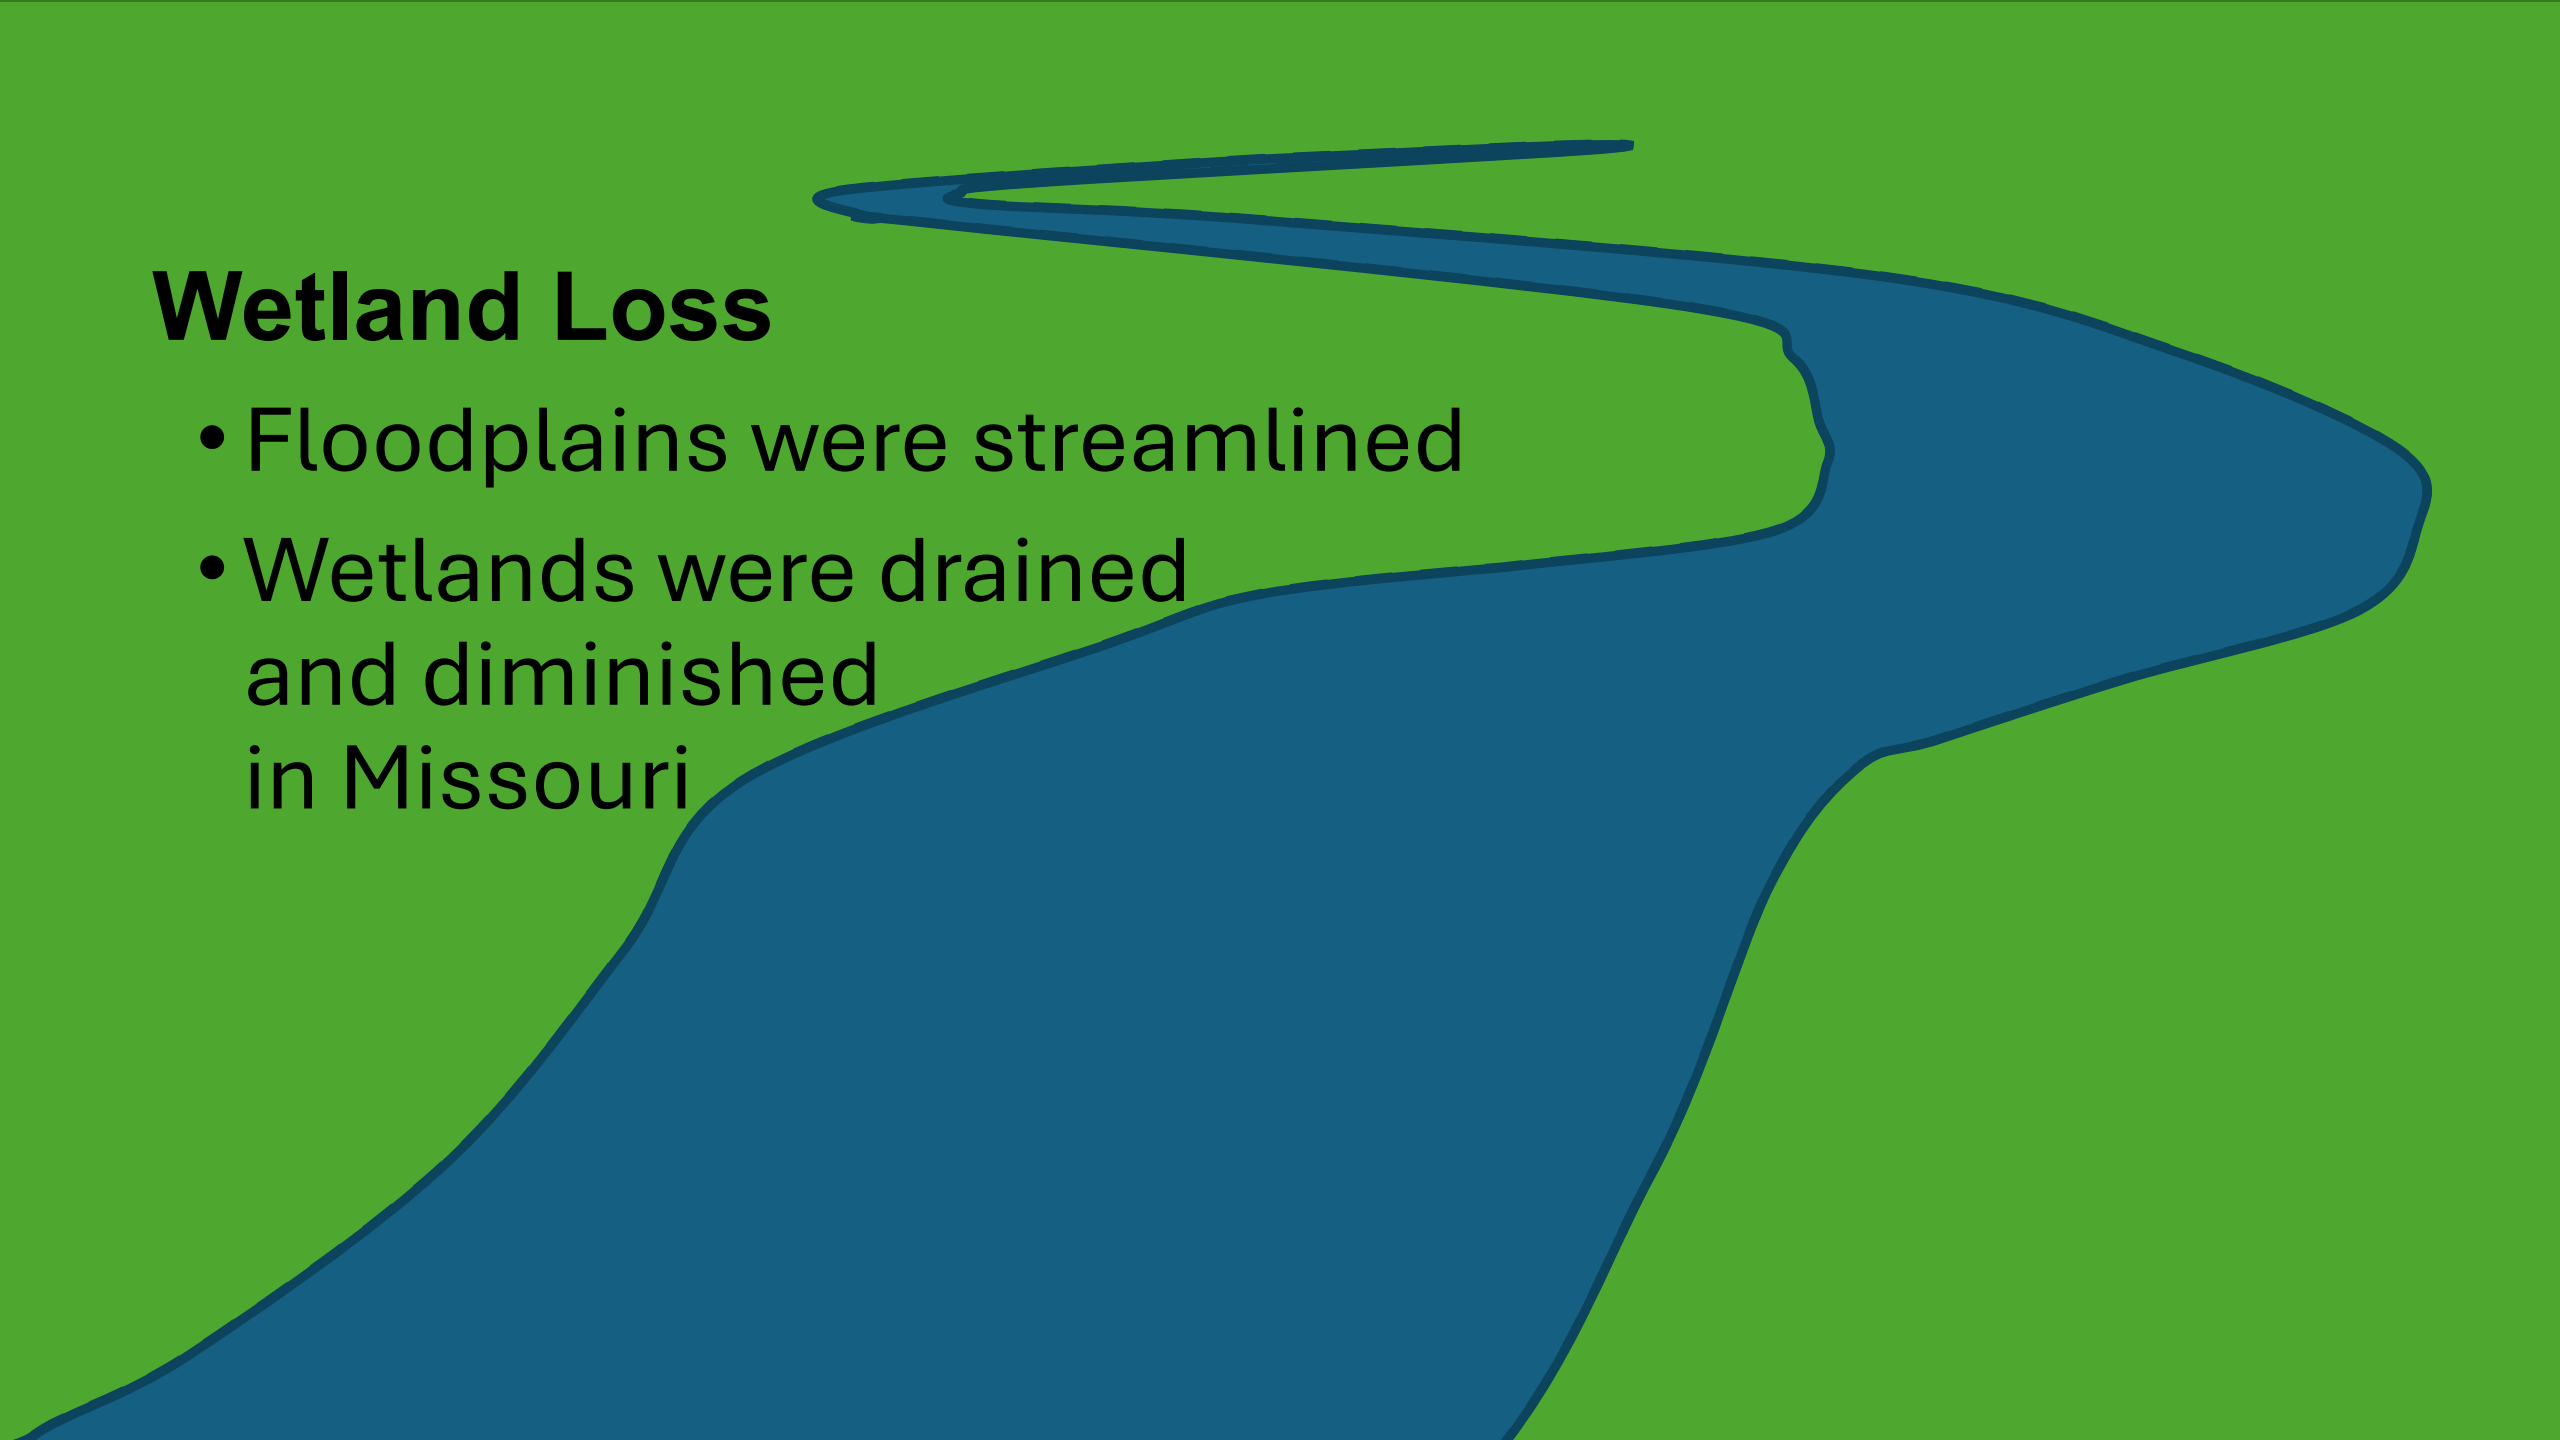

Impacts of Aging

Data used with
caveats

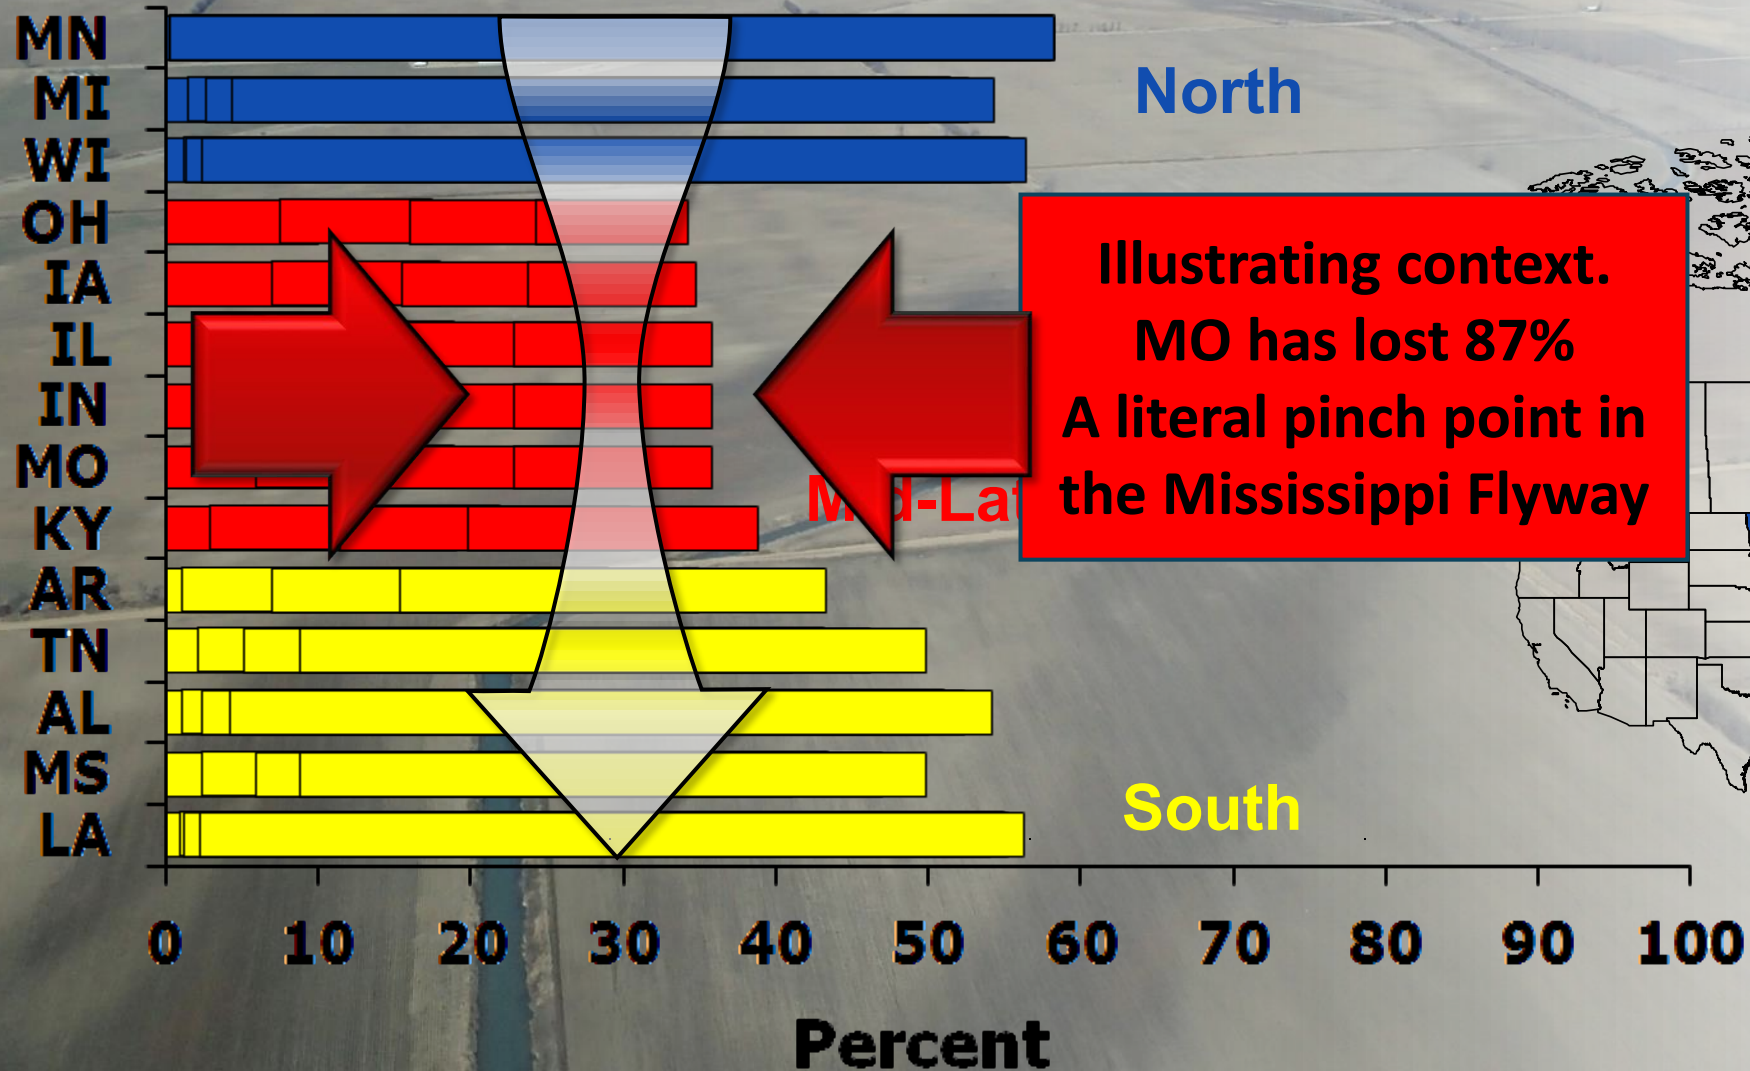

Wetland Loss

- Floodplains were streamlined
- Wetlands were drained and diminished in Missouri

National Status and Trends Reports

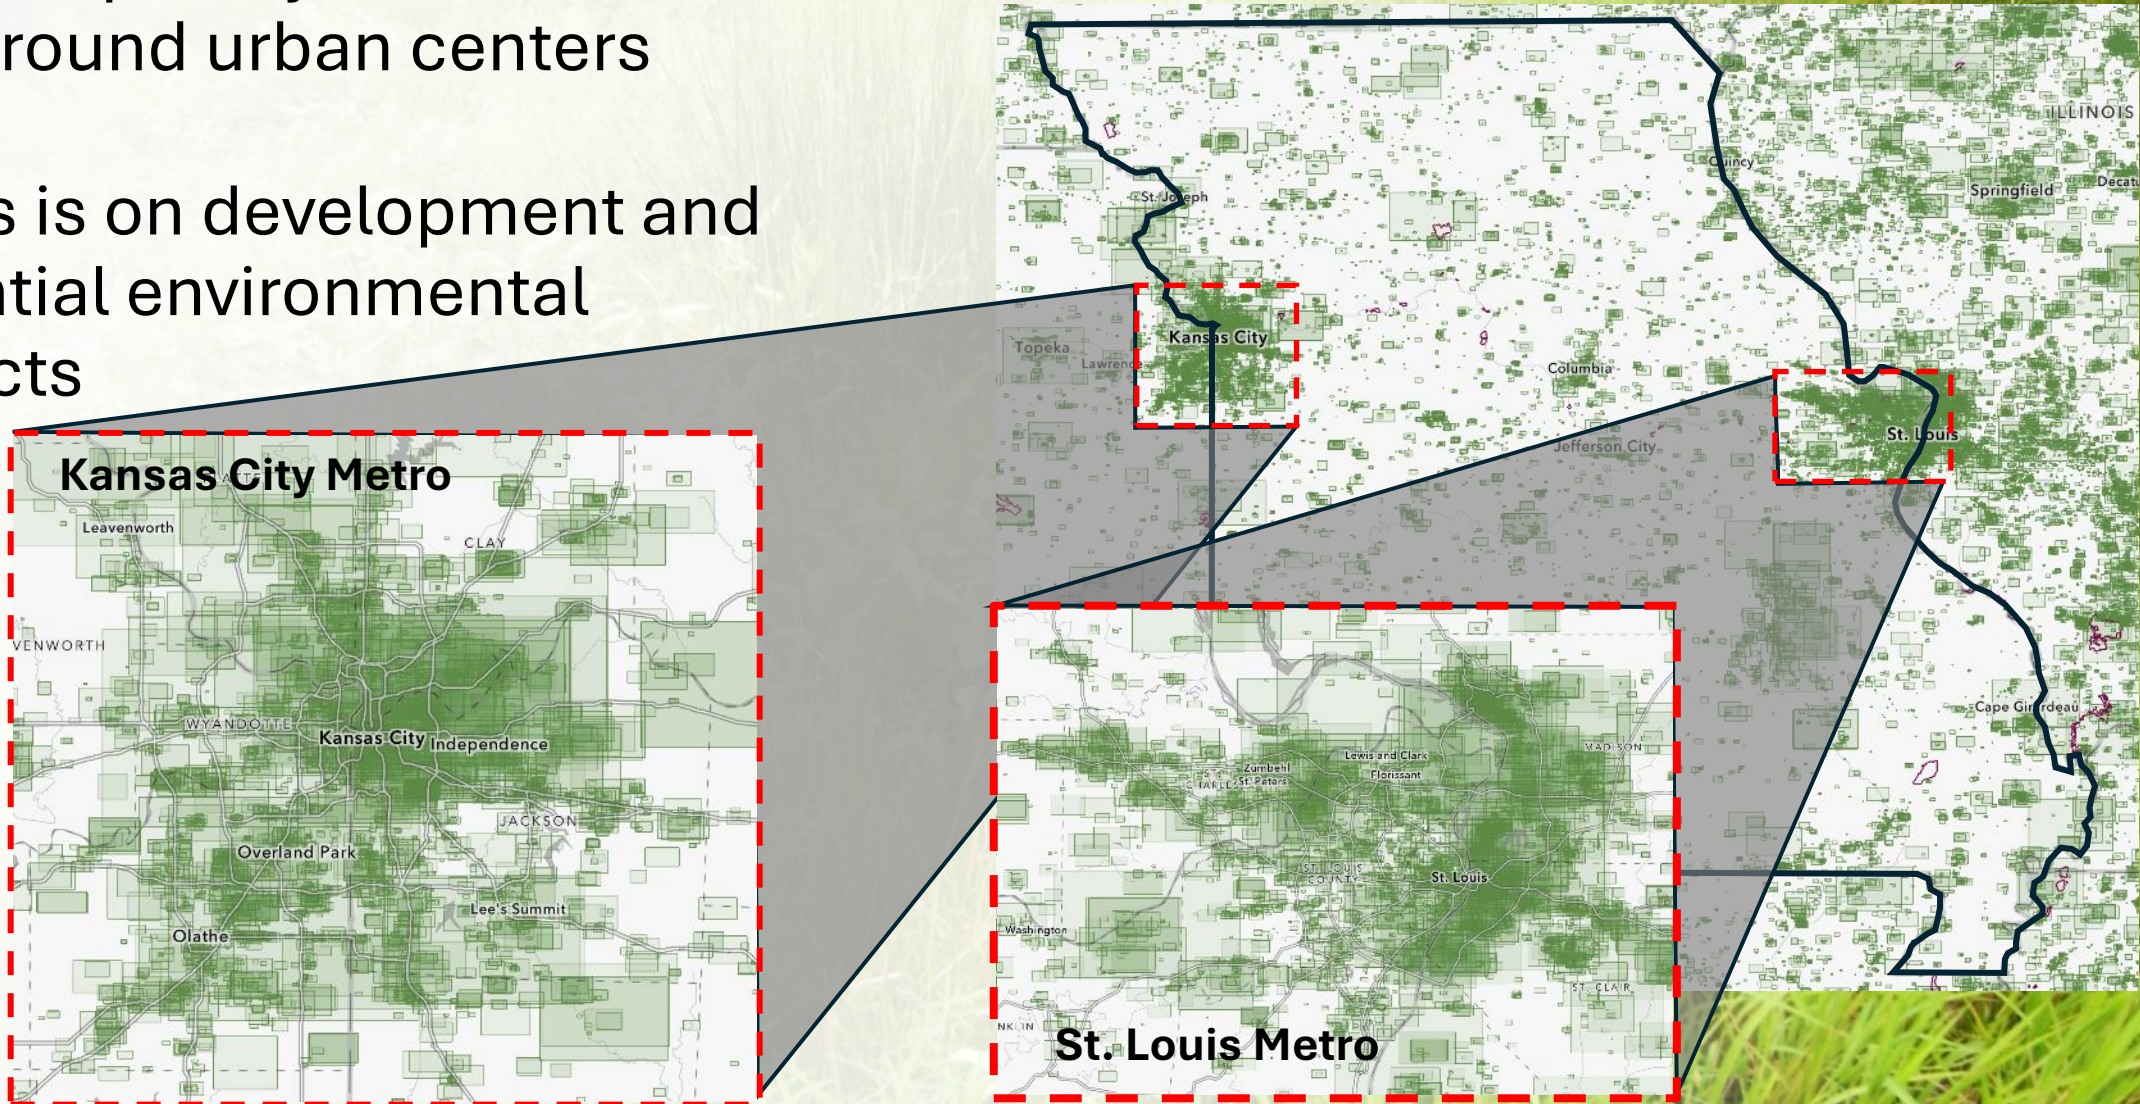

National Status and Trends Reports

- Tracks with observations in Missouri
 - National data comes in handy to cite
- Net wetland loss increased substantially (>50%) since 2009
 - Loss of forested wetlands
 - Increase in ponds

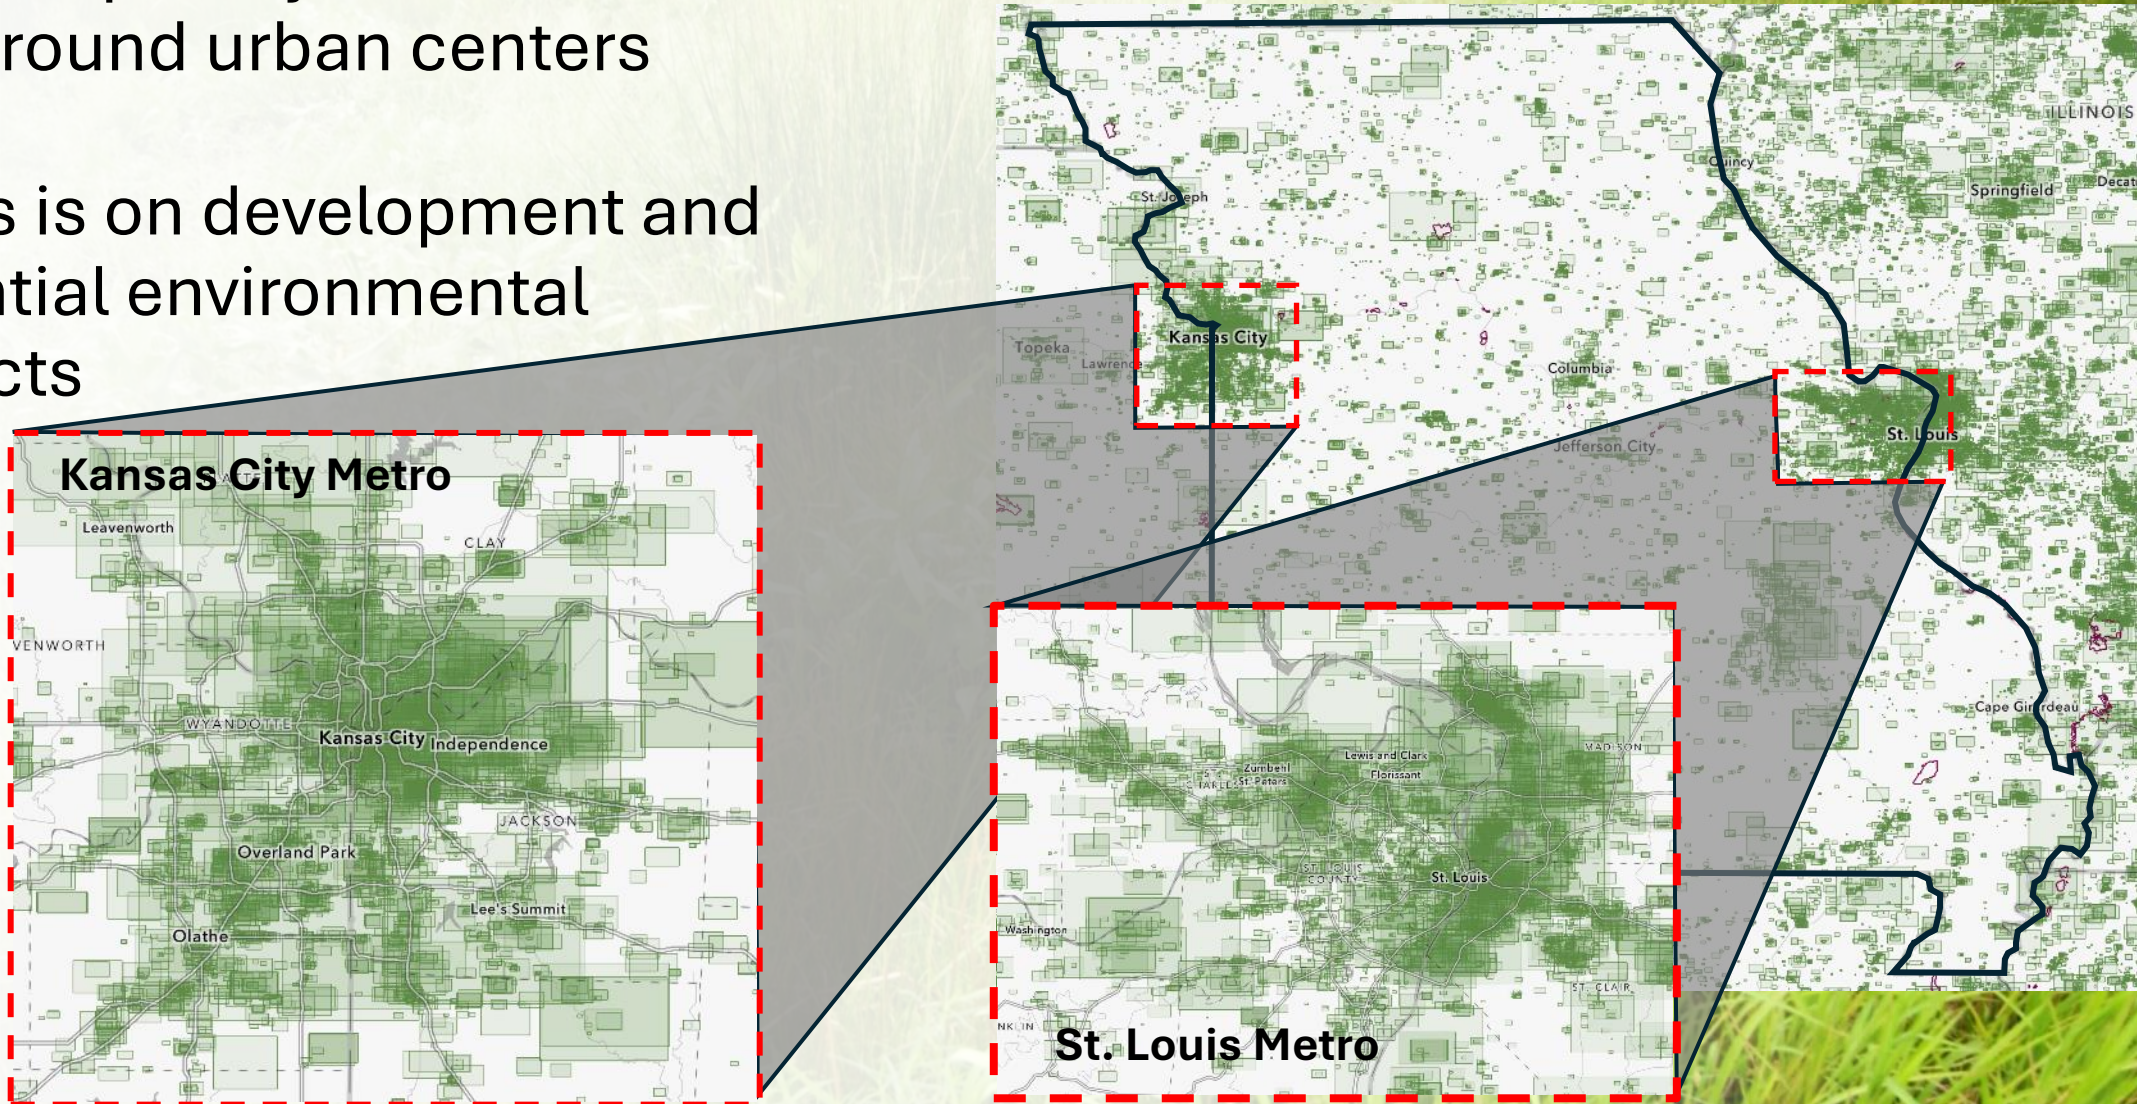

Use of NWI GIS data across Missouri

- Data frequently downloaded in and around urban centers
- Focus is on development and potential environmental impacts

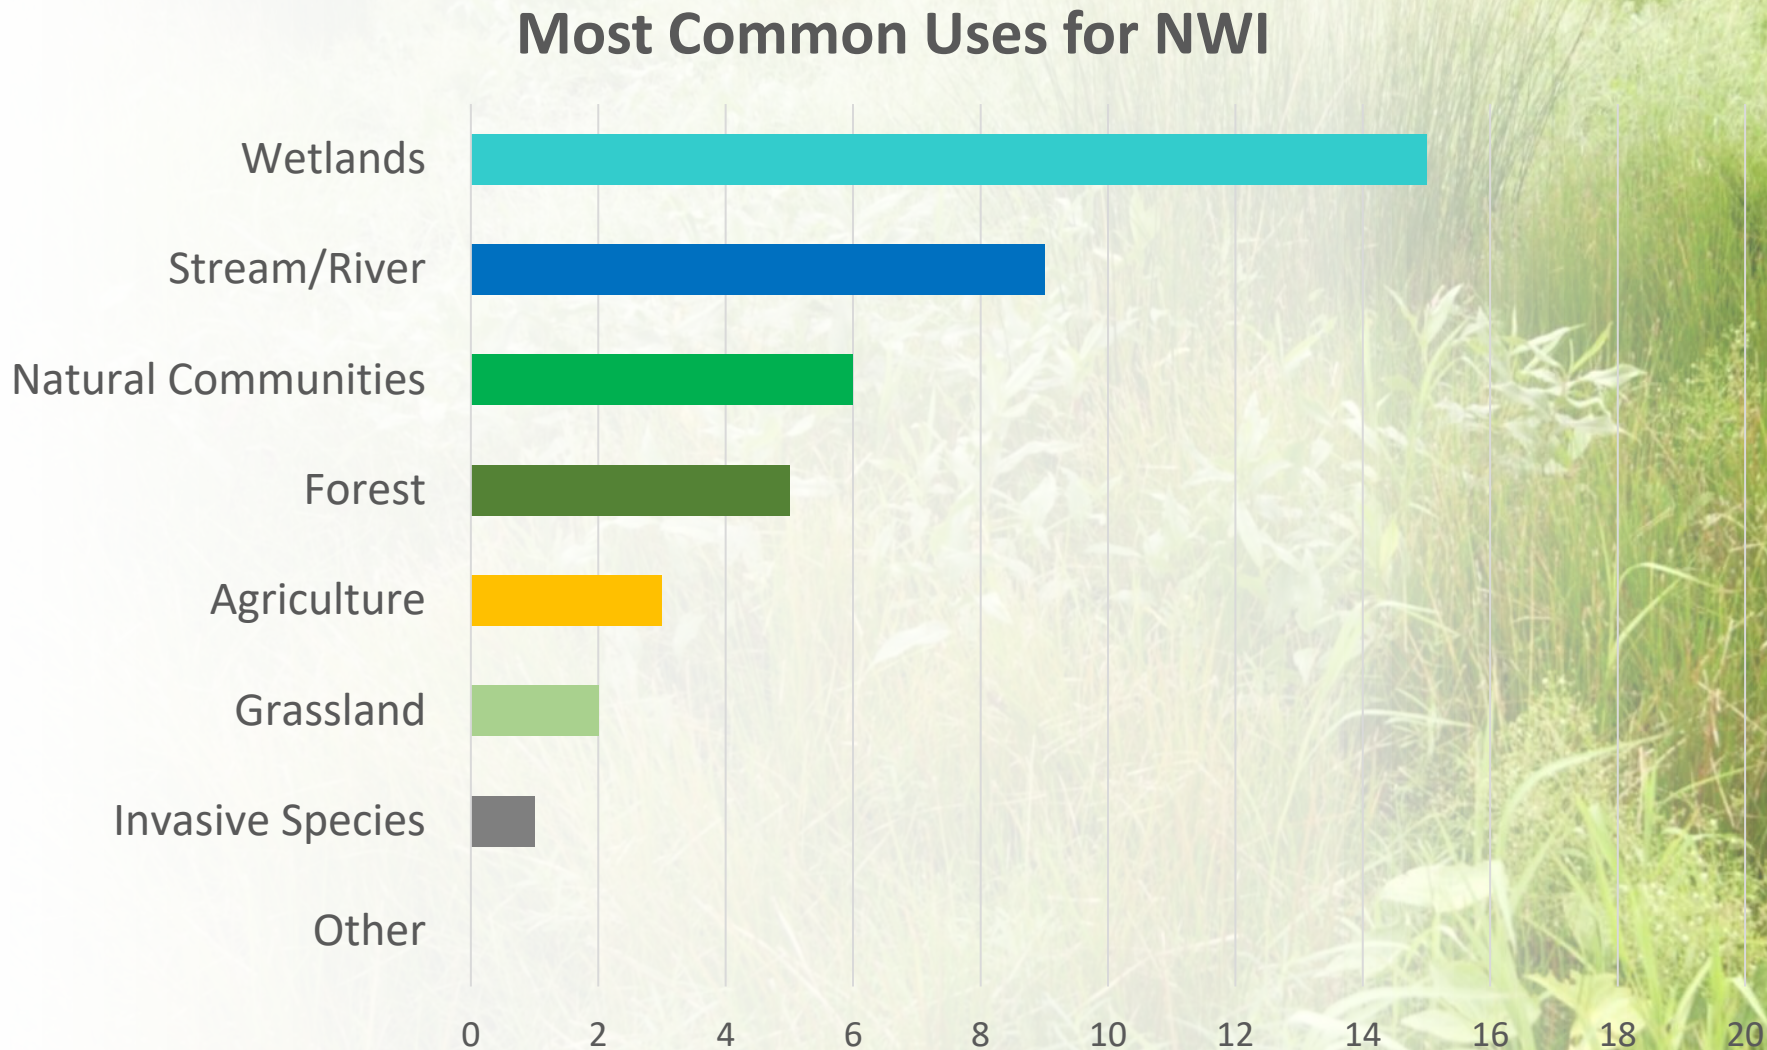

The image displays a map of Missouri with a dense overlay of green and grey polygons representing National Wetlands Inventory (NWI) GIS data. A solid black line outlines the state of Missouri. Two specific urban areas are highlighted with red dashed rectangular borders and labeled with black text: 'Kansas City Metro' in the western-central part of the state and 'St. Louis Metro' in the eastern part. Two grey triangular callout boxes originate from these red-bordered areas. The first callout box points to the 'Kansas City Metro' area, which is shown in a larger, detailed inset map. This inset map displays a dense network of green polygons (wetlands) and grey polygons (developed areas) within the Kansas City region, with labels for Leavenworth, Clay, Wyandotte, Kansas City, Independence, Jackson, Overland Park, Olathe, and Lee's Summit. The second callout box points to the 'St. Louis Metro' area, which is also shown in a larger, detailed inset map. This inset map displays a dense network of green polygons (wetlands) and grey polygons (developed areas) within the St. Louis region, with labels for Washington, St. Louis, St. Clair, and St. Charles. The background of the entire image is a photograph of a lush green field with tall grass.

- The image displays a map of Missouri with a dense overlay of green and grey polygons representing National Wetlands Inventory (NWI) GIS data. A solid black line outlines the state of Missouri. Two specific urban areas are highlighted with red dashed rectangular borders and labeled with black text: 'Kansas City Metro' in the western-central part of the state and 'St. Louis Metro' in the eastern part. Two grey triangular callout boxes originate from these red-bordered areas. The first callout points to a zoomed-in view of the Kansas City Metro area, showing labels for Leavenworth, Clay, Wyandotte, Kansas City, Independence, Jackson, Overland Park, Olathe, and Lee's Summit. The second callout points to a zoomed-in view of the St. Louis Metro area, showing labels for Washington, St. Louis, St. Clair, and St. Louis County. Other cities labeled on the main map include St. Joseph, Topeka, Lawrence, Columbia, Jefferson City, Quincy, Springfield, Decatur, and Cape Girardeau. The background of the slide is a photograph of a green field with tall grass.

Use of NWI GIS data within MDC

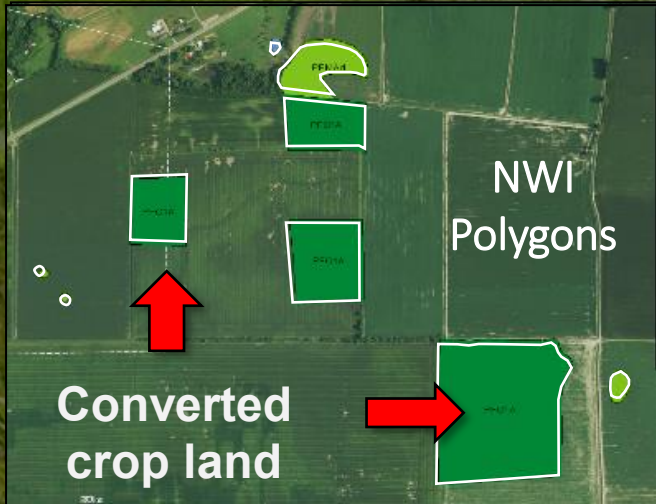

Current Uses For NWI within MDC

- Identify extent of known wetlands
 - To search for Species of Conservation of Concern
 - To search for unique wetlands and their condition
 - Potential fens as identified as PEMb
- Environmental review
- Research, monitoring, planning
- Wetland construction and management
- Wetland determinations
- Restoration

Changes and Uncertainty: Wetlands

Cont. Wetland Loss

Restored Wetlands

Unmapped Wetlands

- How many wetlands exist in Missouri?
- What type?
- What has restoration potential?

Changes and Uncertainty: Wetlands

- What was limiting us and our partners from prioritizing wetland conservation statewide?

Need to update
MO NWI

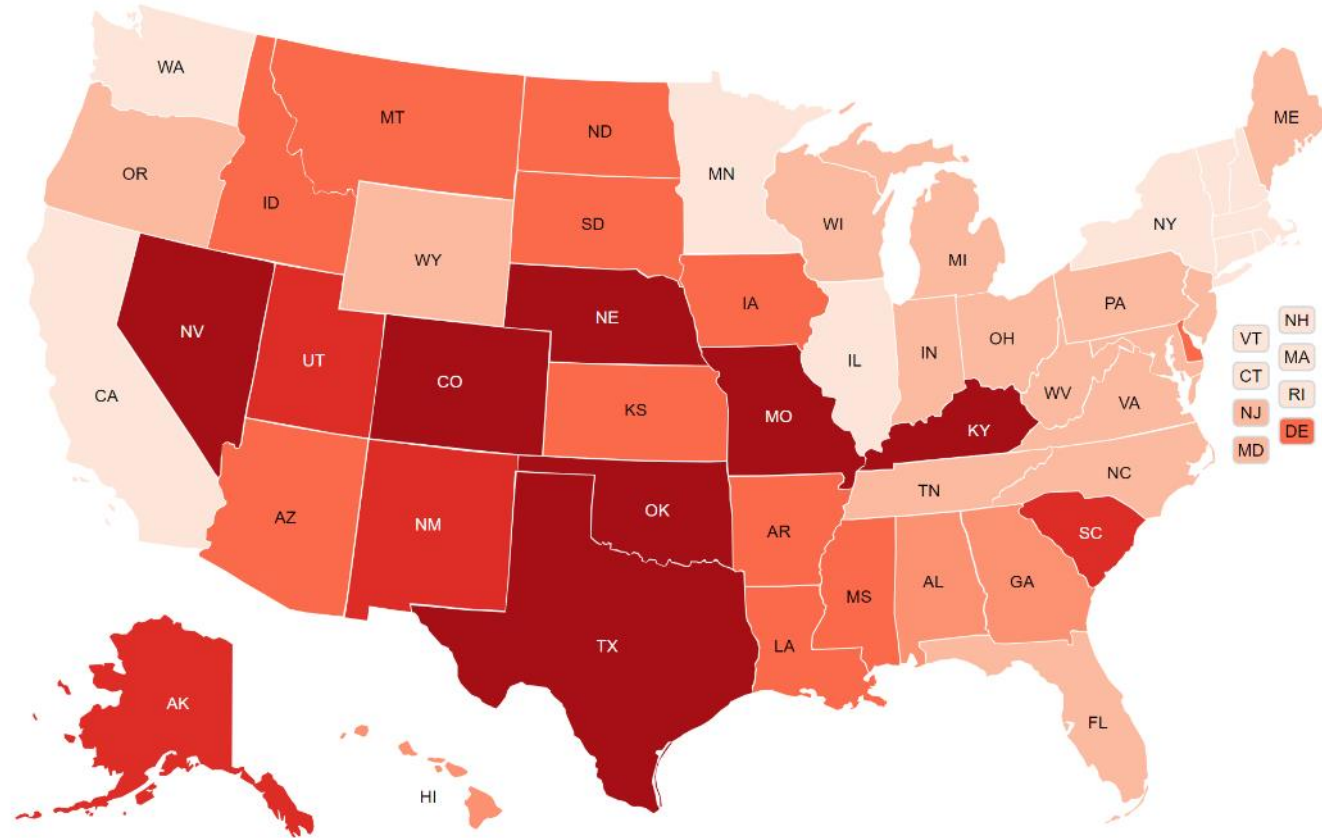

- How many wetlands exist in Missouri?
- What type?
- What has restoration potential?

Wetlands and Streams Most in Danger After the U.S. Supreme Court's *Sackett v. EPA* Ruling

Changes to Legal Protections Increase Wetland Vulnerabilities

Missouri doesn't have state protections and has always deferred to federal protections

← Wetlands and streams most at risk of harmful development and pollution

Wetlands and streams with some protections from harmful development and pollution →

New Uses For updated NWI+

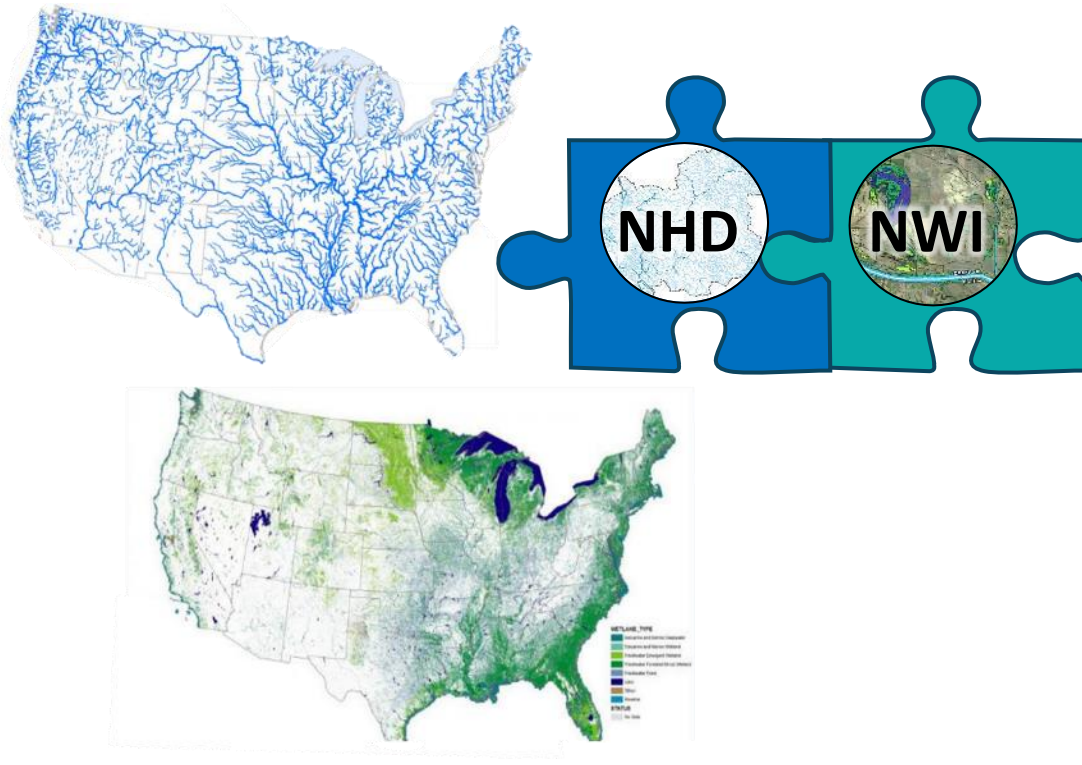

Future Applications

- Create a better/accurate baseline of wetlands in Missouri
- Use to prioritize Wetland Conservation:
 - Protection
 - Management
 - Enhancement
 - Rehabilitation
- Consider Nature-Based Solutions to reduce Flood Risks

Updating MO's Stream and Wetland GIS Layers

• 2020 Discussions Among Partners

Who is interested in collaborating?

Updating MO's Stream and Wetland GIS Layers

• 2022 Actions Among Partners

• Coordinate Steps

- Lidar
- Leaf-Off Imagery
- Leaf-On Imagery
- Hydrography 1st
- Wetlands 2nd

**Updated Hydro
and Wetlands Layers
for Missouri**

Acquire base layers:

Topography:
Fill in gaps

Leaf-Off Imagery:
Current and
Higher Resolution

Updating MO's Stream and Wetland GIS Layers

- NHD is now elevation derived hydrography (**EDH**) data
- As collaboration of agencies, incrementally working our way across Missouri

Updating MO's Stream and Wetland GIS Layers

Updating EDH: Small Watershed Examples

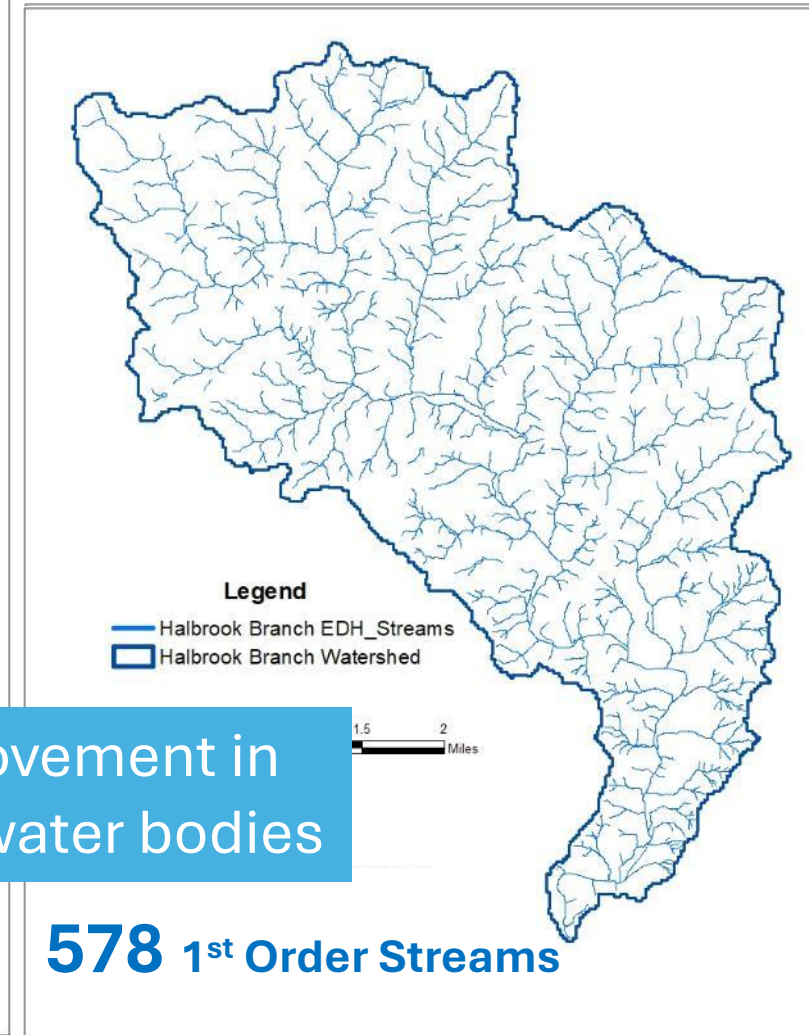

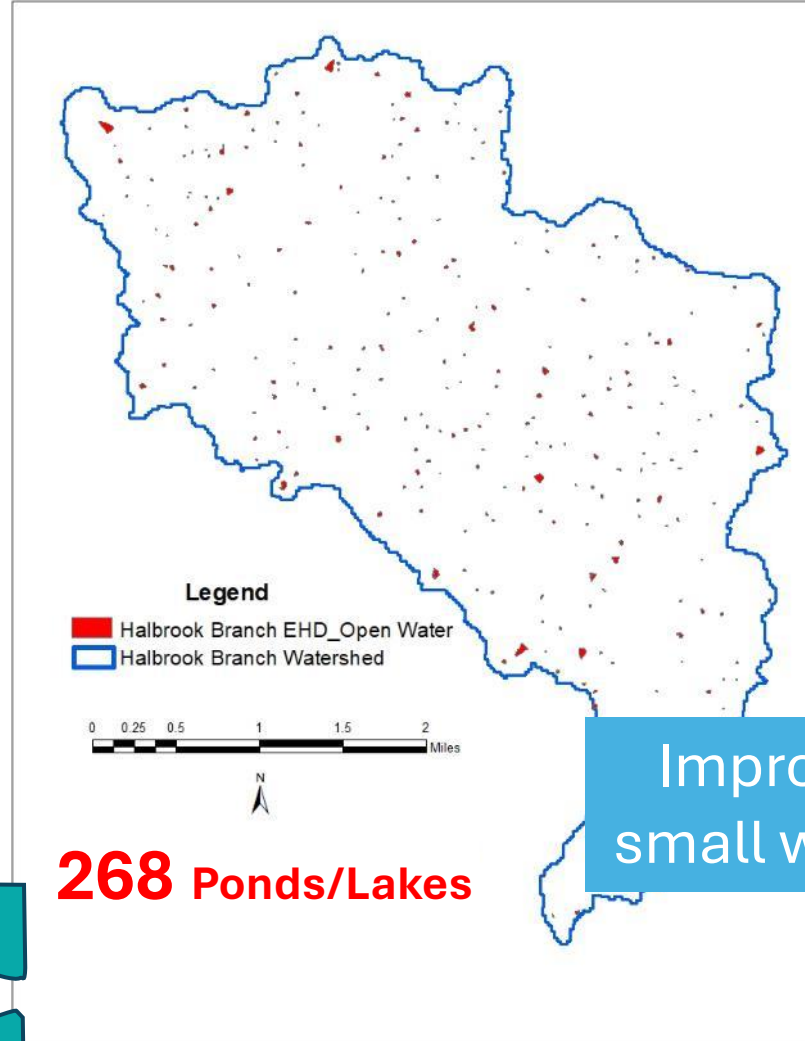

Halbrook Branch: Small Watershed Dent Co.

Old NHD:

12 Open Water Bodies
18 1st Order Streams

EDH:

268 Open Water Bodies
578 1st Order Streams

Improvement in
small water bodies

Using **EDH** as Springboard into **NWI+**

- Just Beginning

- MDC—State Funds
- KC Water—EPA WPP Grant

- Efficiencies Using EDH Deliverables

- Reduces double handling
 - Hydro-enforced DEM's
 - Stream flow network
- Incorporation of pond polygons smaller than federal standard

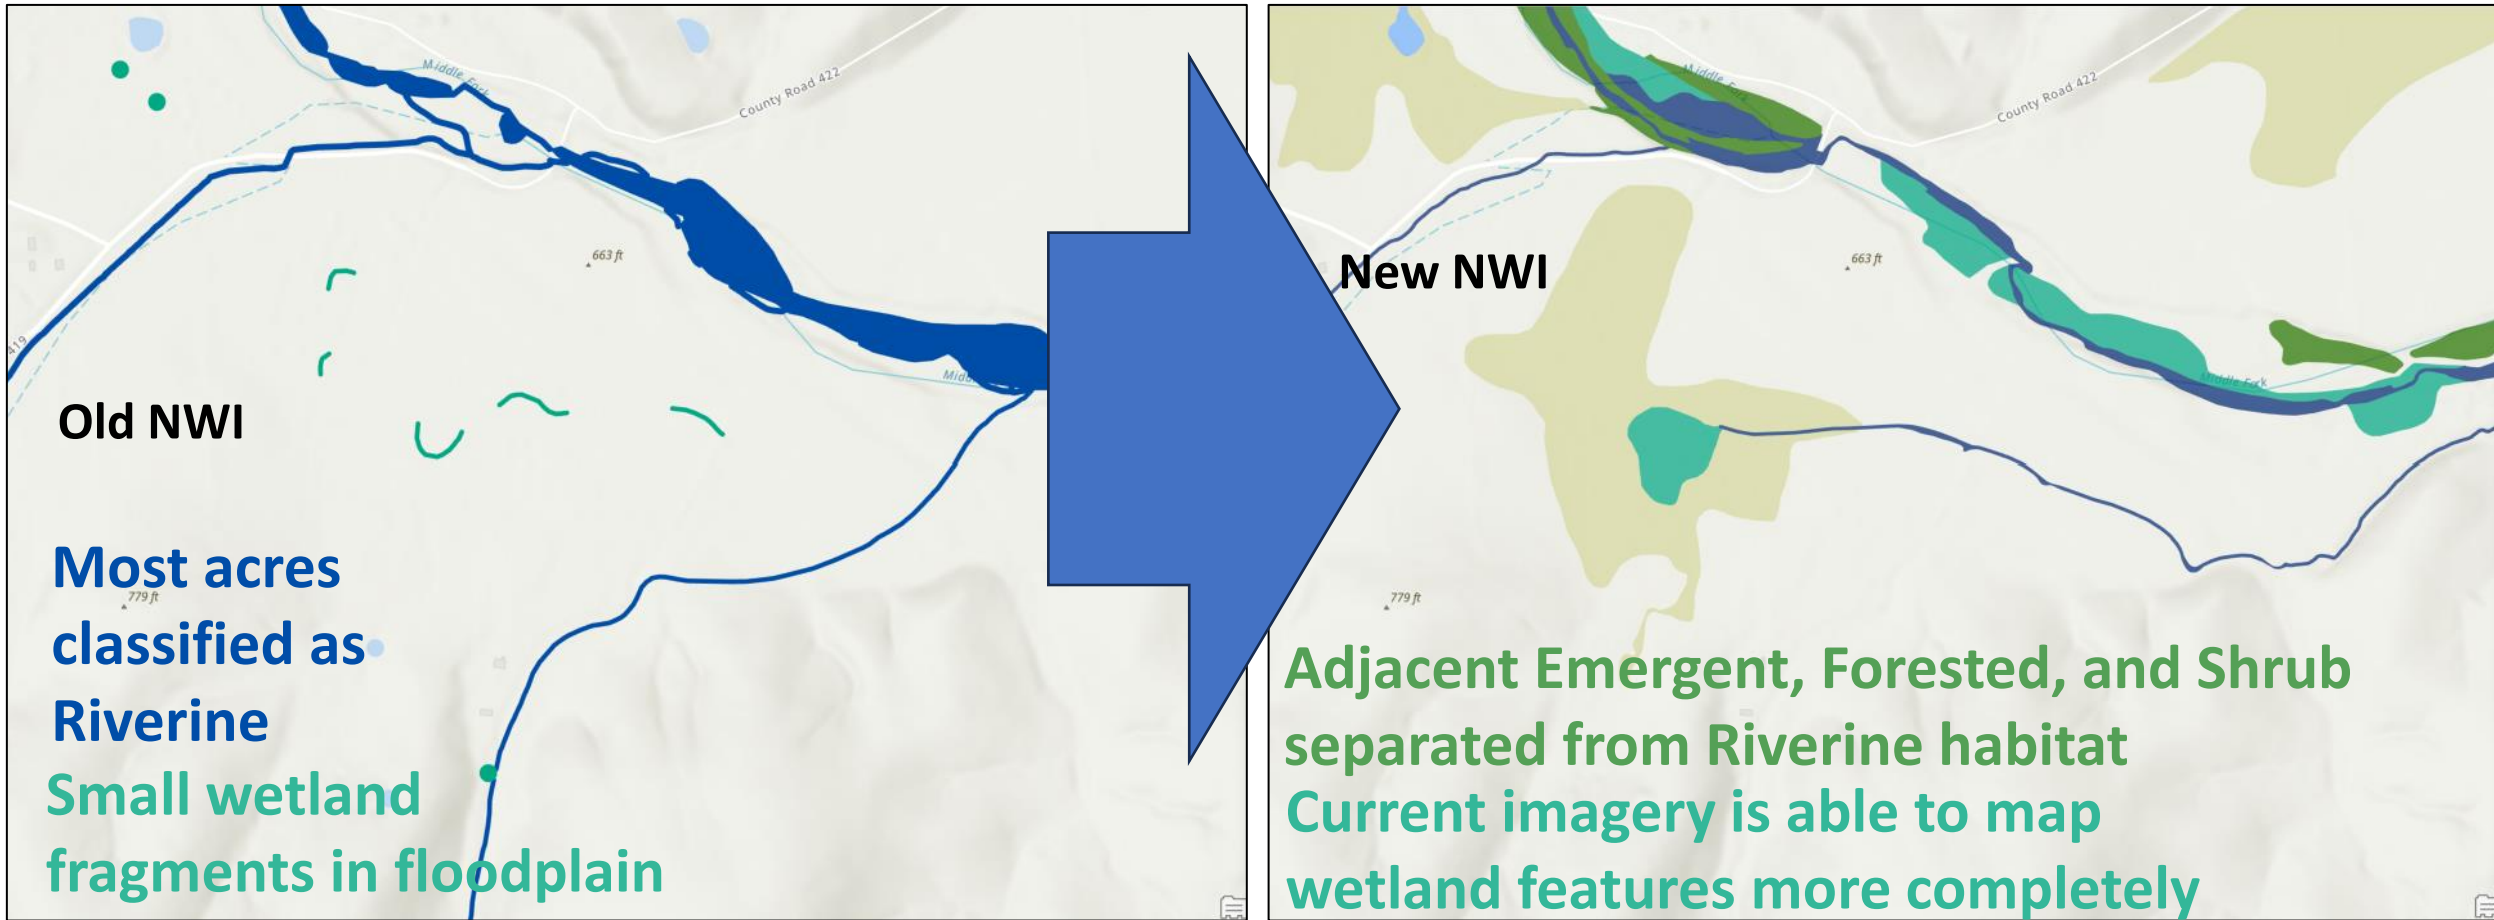

Comparison of Old NWI to New NWI

- Pilot Area: 4 square miles, in the Ozarks near Thomasville

Comparison of Old NWI to New NWI

- Pilot Area: 1 mile across, in the Ozarks near Thomasville

Updating MO's Stream and Wetland GIS Layers

NWI and other National GIS Data is Critical

- Serves an important role for multiple agencies and organizations

Integration is Necessary

- Focusing on a coordinated watershed approach for multiple GIS layers is and will benefit future wetland conservation
